## **Outline for April 7, 2005**

- 1. Miscellaneous ACM points
  - a. *Copy flag*
  - b. Own as a special right
  - c. Principle of Attenuation of Privilege
- 2. What is the safety question?
  - a. An unauthorized state is one in which a generic right r could be leaked into an entry in the ACM that did not previously contain r. An initial state is safe for r if it cannot lead to a state in which r could be leaked.
  - b. Question: in a given arbitrary protection system, is safety decidable?
  - c. Mono-operational protection systems: decidable
  - d. Theorem: there is an algorithm that decides whether a given mono-operational system and initial state is safe for a given generic right.
- 3. General case: It is undecidable whether a given state of a given protection system is safe for a given generic right.
  - a. Represent TM as ACM; reduce halting problem to it
- 4. Take-Grant
  - a. Introduce as counterpoint to HRU result
  - b. Show symmetry
  - c. Show islands (maximal subject-only tg-connected subgraphs)
  - d. Show bridges (as a combination of terminal and initial spans)
- 5. Predicates
  - a. can•share(r, x, y, G<sub>0</sub>) iff there is an edge from x to y labelled r in G<sub>0</sub>, or all of the following hold:
    - i. there is a vertex  $\mathbf{y}'$  with an edge from  $\mathbf{y}'$  to  $\mathbf{y}$  labelled r;
    - ii. there is a subject  $\mathbf{y''}$  which terminally spans to  $\mathbf{y'}$ , or  $\mathbf{y''} = \mathbf{y'}$ ;
    - iii. there is a subject  $\mathbf{x}'$  which initially spans to  $\mathbf{x}$ , or  $\mathbf{x}' = \mathbf{x}$ ; and
    - iv. there is a sequence of islands  $I_1, ..., I_n$  connected by bridges for which **x'** is in  $I_1$  and **y'** is in  $I_n$ .
  - b. Go through interpretation
- 6. Schematic Protection Model
  - a. Model components
  - b. Link function
  - c. Filter function
  - d. Example: Take-Grant as an instance of SPM
  - e. Create operations and attenuation
